Sequence 10, Application US/10094240

Publication No. US20030082637A1

GENERAL INFORMATION:

APPLICANT: 2MIEBEL, LAURENCE J.

TITLE OF INVENTION: ARESTIN GENE, POLYPEPTIDE,

FILE REFERENCE: N8289

CURRENT APPLICATION NUMBER: US/10/094,240

CURRENT FILING DATE: 2001-03-08

AND METHODS OF USE THEREOF

```
APPLICANT: Lillie, James

APPLICANT: Xu, Yongyao

APPLICANT: Wang, Youzhen

APPLICANT: Wang, Youzhen

APPLICANT: Steinmann, Kathleen

TITLE OF INVENTION: NOVEL GENES, COMPOSITIONS, KITS, ANI

TITLE OF INVENTION: FOR IDENTIFICATION, ASSESSMENT, PRI

TITLE OF INVENTION: THERAPY OF BREAST CANCER

FILE REFERENCE: MRI-049

CURRENT APPLICATION NUMBER: US/10/198,846

CURRENT FILING DATE: 2002-07-18

PRIOR APPLICATION NUMBER: 60/306,220

PRIOR FILING DATE: 2001-07-18

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    seq length: 0

```
The sequences given in AAH43389-93 encode protein tyrosine phosphatase (PTPase) polypeptides. The PTPase polypeptides, or the CDNA encoding them, are useful for preventing, treating or ameliorating a medical condition in a mammalian subject. They are useful for disgnosing, condition in a mammalian subject. They are useful for disgnosing, preventing or treating neural disorders (e.g. Alzheimer's disease, cartinitis, grave's disease), immune system disorders (e.g. rheumatoid carthritis, Grave's disease), muscular disorders (e.g. rheumatoid contributes, pulmonary disorders, cardiovascular disorders (e.g. arrhythmias), infectious diseases (e.g. viral hepatitis), contributed contributes (e.g. arrhythmias), infectious diseases (e.g. viral hepatitis), contributed contributes (e.g. multiple sclerosis), endocrine disorders (e.g. diabetes multiple sclerosis), endocrine disorders (e.g. diabetes mellitus), and wound healing and epithelial cell proliferation.

They are also useful for preventing hair loss, to prevent skin aging they are also useful for preventing hair loss, to prevent skin aging due to sunburn, to maintain organs before transplantation, to modulate mammalian characteristics, to treat weight disorders, to change a consummal's mental or physical state, or as a food additive or prevent the consumers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

The invention relates to isolated polynucleotide (I) and Colypeptide (II) sequences. (I) is useful as hybridisation probes, CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The CPC polynucleotides are also used in diagnostics as expressed sequence tags CC for identifying expressed genes. (I) is useful in gene therapy techniques CC (II). (II) is useful for generating antibodies against it, detecting or CC quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical CC disorders involving aberrant protein expression or biological activity. CC The polypeptide and polynucleotide sequences have applications in CC diagnostics, forensics, gene mapping, identification of mutations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  δ B

The present sequence is human protein phosphatase (PP)-4 cDNA.

C PP polynuclectide and polypeptide are useful in the diagnosis, contract the polynuclectide and prevention of immune system disorders, neurological contracts, developmental disorders and cell proliferative disorders. Examples of immune system disorders include acquired immune deficiency contracts of immune system disorders include acquired immune deficiency contracts. Status, asthma, atherosclerosis crohn's disease, amyloidosis, contractivis, disbates mellitus, emphysema, Goodpasture's syndrome, gout, contractivis, disbates mellitus, emphysema, Goodpasture's syndrome, gout, contractivis, disbates mellitus, emphysema, Goodpasture's syndrome, gout, contractivis, syndrome, systemic sclerosis, myasthenia gravis, myocardial or contractivis, syndrome, rheumatoid arthritis, Sjogren's syndrome, contractivis, contractivis, contractivis, syndrome, systemic sclerosis, trauma; neurological disorders syndrome, contractivis, contractivis, contractivis, syndrome, system such as Down's syndrome, cerebral contractive contractive system such as Down's syndrome, cerebral contractive, contractive contractive, seasonal affective disorder such as chizophrenic disorders, seasonal affective disorders such as contractive, contractive,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       16-JUN-2000; 2000US-212447P.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to isolated breast tumour proteins and concluded acids that encode them, including immunogenic fragments of the proteins. Also included are expression vectors expressing the compositions, transformed cells and antibodies raised against the proteins or complete acids may be used in the prevention, diagnosis and treatment of complete acids may be used in the prevention, diagnosis and treatment of complete acids and breast cancer e.g by gene therapy. The nucleic acids and their complements may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in complete, and therefore which patients may be in need of restorative complete, and activity. The antibodies may also be used to identify modulators (e.g. antagonists) of breast tumour protein compression and activity. The antibodies and antagonists may also be used to down regulate expression and activity. The antibodies may also be used to down regulate expression and activity. The antibodies may also be used to down regulate expression and activity. The antibodies may also be used to down regulate expression and activity. The antibodies may also be used to down regulate expression and activity. The antibodies may also be used to down regulate expression and activity. The antibodies may also be used to down regulate activity and activity. The antibodies may also be used to down regulate activity and activity.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Homo sapiens.
                                                                                                                                                                                                                                                                                                          The present invention provides the coding sequences and some protein sequences of proteins associated with breast cancer in humans. These sequences can be used in the diagnosis and treatment of cancers, particularly breast tumours.

The present invention describes isolated, enriched or purified nucleic acids encoding PTP04, SAD, PTP05, PTP10, ALP and ALK-7 proteins. The CC acids encoding PTP04, SAD, PTP05; The above proteins, other than CC present sequence encodes mouse PTP05. The above proteins, other than CC alk-7, are protein tyrosine phosphatases (PTPs) and are used to identify CC substances that modulate their activity (i.e. agonists and antagonists, CC including NBP) in vivo or in vitro. These substances are used to treat CC or prevent diseases associated with abnormal signal transduction CC pathways that involve the proteins, particularly cancer (e.g. leukaemia CC and lymphoma), while modulators of ALK-7 (which is a type I receptor CC serinc/threonine kinase) are used to promote neuronal survival, cc particularly for treating Alzheimer's, Parkinson's or Huntington's CC particularly for treating Alzheimer's, Parkinson's or Huntington's CC proteins can be used as probes to identify and clone related sequences; to detect protein-encoded RNA; to generate transgenic animals and in CC constance of the polynucleotides encoding the constance of the polynucleotides and in the proteins can be used as probes to identify and clone related sequences; and the proteins can be used as probes to identify and clone related sequences; and the proteins can be used as probes to identify and clone related sequences; and the proteins can be used as probes to identify and clone related sequences; and the proteins can be used to determine the proteins can be used to determine the proteins can be used to protein the protein to determine the protein contains and the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CC The present invention describes isolated, enriched or purified nucleic acids encoding PTP04, SAD, PTP05, PTP10, ALP and ALK-7 proteins. The CC acids encoding PTP04, SAD, PTP05. The above proteins, other than CC ALK-7, are protein tyrosine phosphatases (PTPs) and are used to identify CC substances that modulate their activity (i.e. agonists and antagonists, CC including NBP) in vivo or in vitro. These substances are used to treat CC or prevent diseases associated with abnormal signal transduction CC pathways that involve the proteins, particularly cancer (e.g. leukaemia CC and lymphoma), while modulators of ALK-7 (which is a type I receptor CC serine/threonine kinase) are used to promote neuronal survival, CC particularly for treating Alzheimer's, Parkinson's or Huntington's CC diseases. Nucleic acid fragments of the polynucleotides encoding the CC proteins can be used as probes to identify and clone related sequences; to detect protein-encoded RNA; to generate transgenic animals and in CC gene therapy (optionally after mutation). Ab are used to determine the

CC comprising a polynucleotide encoding a protein operably linked with a CC comprising a polynucleotide encoding a protein operably linked with a CC charge providing gene therapy for genetic deficiency disorders. Vectors of the CC providing gene therapy for genetic deficiency disorders. Vectors of the CC invention are useful for delivering a polynucleotide encoding a protein CC to a vertebrate cell preferably a mammalian cell, such as a human cell. CC particle, or by transfection, transduction, or injection either in vitro CC or in vivo. The vector is useful for the delivery and expression of CC delivering large DNA segments for engineering of vertebrate cells. CC Polynucleotides of the invention have applications in techniques such as CC chief use as insertion sites for foreign genes of interest, hybridisation CC cells, and are adapted for accepting large heterologous DNA in host CC cells, and are adapted for accepting large heterologous DNA in host CC cells, and are adapted for accepting large heterologous DNA in host CC cells, and can be delivered in an infected or transformed cell and CC cangenon of the genome of the genus B entomopoxvirus from amsacta moorei CC cangenon of the genome of the genus B entomopoxvirus from amsacta moorei
                                                                                                                                                                                                                                                                                                 Ş

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  В
                                              The invention relates to a nucleic acid comprising a sequence of 18 CC bases, of a segment of chemically pretreated DNA (CP DNA) e.g. with CC bisulphite, of genes associated with tumour suppression and oncogenes having a sequence taken from 536 (actually 533 since CC (SS) and sequences complementary to (SS). The nucleic acid may be a CC (SS) and sequences complementary to (SS). The nucleic acid may be a cC (SS) and sequences complementary to (SS). The nucleic acid may be a cC (SS) and sequences for detecting the cytosine methylation state CC (SS) and/or single nucleotide polymorphisms and also to be used in an CC (SS) and sequences. The probes can also be used in an CC (SS) and sequences associated with CpC dinucleotides e.g. CC (SS) and/or therapy of existing diseases or the predisposition to specific diseases, by analysing cytosine methylations. The parameters may be CC (differences serving as basis for diagnosis and/or parameters, the CC (differences serving as basis for diagnosis and/or prognosis events which are disadvantageous to patients. The present sequence is one of the CC (concerns.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  15-MAR-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes isolated, enriched or purified nucleic acids encoding PPP04, SAD, PPP05, PPP10, ALP and ALK-7 proteins. The present sequence encodes mouse PFP05. The above proteins, other than ALK-7, are protein tyrosine phosphatases (PTP9) and are used to identify substances that modulate their activity (1.e. agonists and antagonists, including NBP) in vivo or in vitro. These substances are used to treat or prevent diseases associated with abnormal signal transduction pathways that involve the proteins, particularly cancer (e.g. leukaemia and lymphoma), while modulators of ALK-7 (which is a type I receptor serine/threonine kinase) are used to promote neuronal survival, particularly for treating Alzheimer's, Parkinson's or Huntington's diseases. Nucleic acid fragments of the polynucleotides encoding the proteins can be used as probes to identify and clone related sequences; to detect protein encoded RNA; to generate transgenic animals and in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               PTP04; PTP05; PTP10; SAD; ALP; ALK-7; protein tyrosine phosphatase; type I receptor serine/threonine kinase; cancer; leukaemia; lymphom neurodegenerative disease; neuronal survival; Alzhelmer's disease; parkinson's disease; Huntington's disease; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New nucleic acid encoding specific protein tyrosine phosphatases useful for identifying specific modulators for treatment and prevention of cancer and neurodegenerative disease

CC bases, of a segment of chemically pretreated DNA (CP DNA) e.g. with CC bases, of a segment of chemically pretreated DNA (CP DNA) e.g. with CC oncogenes having a sequence taken from 536 (actually 533 since CC numbers 408, 458 and 500 are missing from the sequence listing) sequences CC (Ss) and sequences complementary to (Ss). The nucleic acid may be a CC form part of a set of probes for detecting the sytosine methylation state CC and/or single nucleotide polymorphisms and also to be used in an CC array for analysing diseases associated with CpG dinucleotides e.g. CC and/or single nucleotide polymorphisms and also to be used in an CC ancers and tumours. The probes can also be used in a method for CC and/or therapy of existing diseases or the predisposition to specific CC and/or therapy of existing diseases or the predisposition to specific CC diseases, by analysing cytosine methylations. The parameters may be CC compared to another set of genetic and/or epigenetic parameters, the CC differences serving as basis for diagnosis and/or prognosis events which CC are disadvantageous to patients. The present sequence is one of the CC complementary sequences with even numbered Seq ID numbers are the CC complementary sequence of the corresponding odd numbered sequence (e.g. ID 2 and ID1.) ID 536 and ID 535, except for those whose partner sequence CC is missing).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches 313; Conservative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to nucleic acids containing a sequence of at least 18 nucleotides of chemically treated DNA of genes associated with DNA repair, and their complements. The invention also relates to nucleic acids comprising at least 18 base pairs of the chemically pretreated DNA of genes associated with DNA repair selected from PMS2L1, PMS2L12, PMS2L25, PMS2L5, PMS2L5, PMS2L5, PMS2L5, PMS2L5, PMS2L5, PMS2L5, PMS2L5, PMS2L6, MCMT, MSH2, NUDT1, TDG, INPPL1, RFC4, DDIT1L, FANCB, or XRCC8. Nucleic acids of the invention and related oligomers, are useful for diagnosis of diseases associated with gene repair, specifically ataxia telangiectasia, aging, Bloom's syndrome, Cockayne syndrome, Nijmegen breakage syndrome or Werner syndrome, Cockayne syndrome, Itichthodystrophy, Fanconi's anaemia, solid tumours immunodeficiency, trichthodystrophy, Fanconi's anaemia, solid tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  and cancer, particularly by determining status of cytosine methylation and/or by detecting single-nucleotide polymorphisms. Determination of individual methylation patterns may allow development of individualised therapies. The sequences given in records ABL92192-ABL9235 represent chemically pre-treated DNA fragments from genes associated with DNA repair, and their complements.

Note: The sequence data for this patent is not represented in the specification, but is based on sequence information supplied by the European Patent Office.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New nucleic acid derived from genes associated with DNA repair, useful for diagnosis, e.g. of ataxia telangiectasia, by determination of cytosine methylation -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 1; SEQ ID NO 127; 25pp + sequence listing; English.

                                                                  Query Match
                                                                                                                             The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer's disease, AIDS, epilepsy, neurofibromatosis, rheumatolid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      antiarteriosclerotic; antianaemic; cytostatic; nootropic; neuroprotective; anti-HIV; anticonvulsant; optibalmological; antirheumatic; antiarthritic; antidiabetic; antipsoriatic; antiinflammatory; cancer; eye disease; arteriosclerosis; anaemia; acute myeloid leukaemia; Alzheimer's disease; AIDS; epilepsy; neurofibromatosis; rheumatoid arthritis; psoriasis; bowel disease;

The sequences are useful for detecting the methylation state of all CpG dinucleotides in a sequence and therefore for analysing associated diseases. By analysing cytosine methylations in the pretreated DNA, genetic and/or epigenetic parameters for the diagnosis and therapy of existing diseases or the predisposition to specific diseases can be ascertained. The parameters may be compared to another set of genetic and/or epigenetic parameters, the differences serving as basis for the sequences of the invention are useful for the diagnosis and therapy of HIV infection, neurodegenerative disorders, graft-versus-host disease, aging, glomerular disease, Lewy body disease, arthritis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Designing primers and probes for analysing diseases associated with cytosine methylation state e.g. arthritis, cancer, aging, arteriosclerosis comprising fragments of chemically modified genes associated with cell cycle -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         30-JUN-2000; 2000DE-1032529.

                                                                                                                                                                                                                                  diagnosing or treating diseases associated with DNA transcription (particularly with the methylation status), e.g. adenosine deaminase deficiency, viral infection, retroviral infection, Sezary syndrome, haematological disorders, immunological disorders, Werner syndrome, tuberculosis, developmental disorders, psoriasis, Rieger's syndrome, neurological disorders, neurodegenerative disorders, Warneraburg syndrome, Niemann-Pick disease, myelodysplastic syndrome, myocardial infarction, hypertension, angiogenesis, erythropoiesis, congenital heart disease, HDR syndrome, arthritis, polyglutamine disorders, solid tumours or cancer. Sequences ABK28127-ABK28472 represent DNA transcription associated genomic DNA molecules of the invention.

Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format directly from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a nucleic acid, which comprises a segment of the chemically pretreated DNA of genes associated with DNA transcription from one of 346 sequences, and an ollgomer, in particular an ollgonucleotide or peptide nucleic acid (PNA)-ollgomer that hybridises to or is identical to the chemically pretreated DNA of genes associated with DNA transcription. The set of oligomer probes are useful for detecting the cytosine methylation state and/or single nucleotide polymorphisms (SNPs) in a chemically pretreated genomic DNA. The nucleotide are useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                neurodegenerative disorder; Waardenburg syndrome; Niemann-Pick disease; myelodysplastic syndrome; myocardial infarction; hypertension; arthritis; angiogenesis; congenital heart disease; HDR syndrome; gene therapy; polyglutamine disorder; solld tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New nucleic acids or oligomers, useful for diagnosing or treating diseases associated with DNA transcription, e.g. immunological disorders, Werner syndrome, psoriasis, myocardial infarction, solid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              06-APR-2000; 2000DE-1019058.
